

Reports to ITAC – June 12, 2007

Computer Operations:

DASD utilization has increased slightly this past month due to support for year-end processing. Additionally, more storage is going to be released that was previously associated with the IDMS systems.

On March 18th added 41 more MIPS to help create a more manageable safety buffer and reduce cost associated when activating Capacity on Demand on an as needed basis. CPU utilization has stabilized and we will continue to monitor CPU utilization.
